FOR INTERNAL CIRCULATION ONLY

Sociodemographic shifts put our healthcare system under significant strain

- Greater demand for healthcare in the context of a reduced workforce to deliver this healthcare

The epidemiologic transition

Transforming healthcare

Why?

- The current model of healthcare is designed for the treatment of acute conditions that can be cured.
 - The major burden of disease today related to chronic disease that have to be managed over a lifetime
 - Fragmented and uncoordinated
 - Waste
 - Adverse outcomes
 - Reactive and often futile
 - Many of the adverse outcomes associated with chronic disease are irreversible by the time they present
- Largely still limited to the office consult as the means of engagement
- Limited involvement of the patient
 - Management of chronic disease requires patient participation which involves more than taking the medications that we give them
- **INNOVATION IS KEY TO OUR ABILITY TO MEET THE HEALTHCARE NEEDS OF OUR POPULATION**

When a movie says
'based on a true story',
it gets 10 times scarier.

The GLU-COURSE

THE GLU-COURSE

**An online module on Inpatient DM Management
for NUHS Residents & Pharmacists**

LET'S GET STARTED!

Brought to you by Division of Endocrinology 2013

Day 1 of admission

You are the medical resident and you are asked to clerk a new admission at 1500h.

Mr C is a 75 year old Chinese gentleman with Type 2 DM for 15 years and a recent HbA1c of 7.5%. He is on Mixtard (30/70) 16 units pre-breakfast and 8 units pre-dinner.

He is admitted for infective exacerbation of COPD and will receive prednisolone 30mg OM for the next 5 days. Investigations show normal renal function.

His symptoms have improved with treatment in EMD and he is allowed to take a full diet.

Day 1 of ad

You are clerking him at 5pm. His POCT reading in EMD at 3pm was 8.0 mmol/L. Hydrocortisone 100mg was given at 4pm.

What will you order for DM management

- Mixtard 16 units pre-breakfast and 8 units pre-dinner, with pre-meal supplemental SCSi
- Mixtard 20 units pre-breakfast and 12 units pre-dinner, with pre-meal supplemental SCSi
- Mixtard 10 units pre-breakfast and 4 units pre-dinner with pre-meal supplemental SCSi
- Stop Mixtard and switch to insulin sliding scale

Submit Answer

INCORRECT

Sorry, you selected the incorrect option.

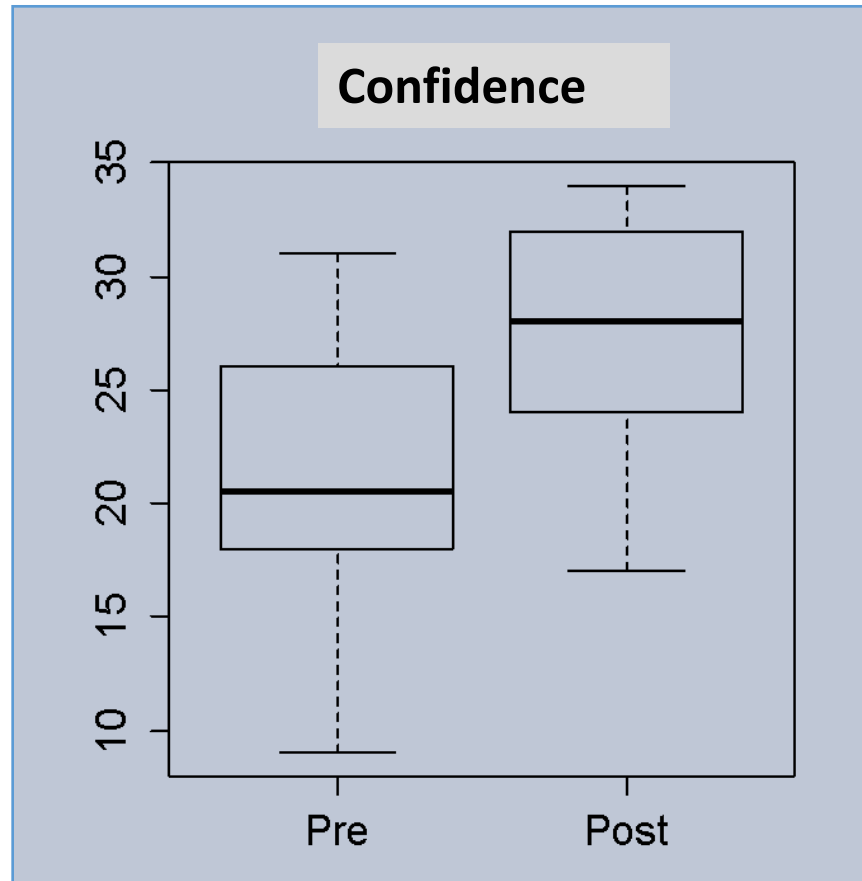

Proceed to Explanation

Nursing Confidence Level

Resident's confidence level

- Mean confidence score (n=21) increased from 21.15 to 27.50 (maximum score = 36), $p < 0.05$

Hypoglycemia –

% of patient-days (on glucose monitoring) with at least 1 episode of hypoglycemia by ward

Ward 54 Percentage of patient days with at least 1 episode of <4mmol/L

Ward 6B % of patient-days with at least 1 episode of <4

Mean patient -day glucose (mmol/L) by ward

Hyperglycemic index per admission by ward

Why am I telling you this story?

- Not all important innovation involves molecules and cells
- Clinician Scientists are just clinicians who innovate in healthcare
 - Kao Shih Ling who led this project is a current holder of a transition award
 - Her HOD at that time was the holder of a CSA
 - In her division, Dr Khoo Chin Meng (CSA) chaired the National Steering Committee for Diabetes Mellitus; Dr Yew Tong Wei (current holder of a CS-NIG) is working on patient engagement
- Find an organization that values you as a clinician and values innovation.
- Constantly look for opportunities to innovate and improve the health of your patients.
- If you do that, your career in the healthcare system will follow naturally

One last thing

- Treat grants as the way to fund your innovative efforts and publications as the way you communicate what you do to others—not as an end in themselves.

Utilizing distributional analytics and electronic records to assess timeliness of inpatient blood glucose monitoring in non-critical care wards

Ying Chen¹, Shih Ling Kao², E-Shyong Tai², Hwee Lin Wee^{1,3}, Eric Yin Hao Khoo³, Yilin Ning², Mark Kevin Salloway¹, Xiaodong Deng³ and Chuen Seng Tan^{1*}

Abstract

Background: Regular and timely monitoring of blood glucose (BG) levels in hospitalized patients with diabetes mellitus is crucial to optimizing inpatient glycaemic control. However, methods to quantify timeliness as a measurement of quality of care are lacking. We propose an analytical approach that utilizes BG measurements from electronic records to assess adherence to an inpatient BG monitoring protocol in hospital wards.

Methods: We applied our proposed analytical approach to electronic records obtained from 24 non-critical care wards in November and December 2013 from a tertiary care hospital in Singapore. We applied distributional analytics to evaluate daily adherence to BG monitoring timings. A one-sample Kolmogorov-Smirnov (1S-KS) test was performed to test daily BG timings against non-adherence represented by the uniform distribution. This test was performed among wards with high power, determined through simulation. The 1S-KS test was coupled with visualization via the cumulative distribution function (cdf) plot and a two-sample Kolmogorov-Smirnov (2S-KS) test, enabling comparison of the BG timing distributions between two consecutive days. We also applied mixture modelling to identify the key features in daily BG timings.

Results: We found that 11 out of the 24 wards had high power. Among these wards, 1S-KS test with cdf plots indicated adherence to BG monitoring protocols. Integrating both 1S-KS and 2S-KS information within a moving window consisting of two consecutive days did not suggest frequent potential change from or towards non-adherence to protocol. From mixture modelling among wards with high power, we consistently identified four components with high concentration of BG measurements taken before mealtimes and around bedtime. This agnostic analysis provided additional evidence that the wards were adherent to BG monitoring protocols.

Conclusions: We demonstrated the utility of our proposed analytical approach as a monitoring tool. It provided information to healthcare providers regarding the timeliness of daily BG measurements. From the real data application, there were empirical evidences suggesting adherence of BG timings to protocol among wards with adequate power for assessing timeliness. Our approach is extendable to other areas of healthcare where timeliness of patient care processes is important.
