

The Changing Face of Biomedical Research and What This Means for the Clinician Scientist: *The Example of Liver Cancer*

Pierce K.H Chow FRCSE PhD

Professor, DukeNUS Medical School Singapore

Surgical Director, Comprehensive Liver Cancer Clinic, NCC Singapore

Senior Consultant Surgeon, Singapore General Hospital

NMRC Senior Clinician Scientist

RESEARCH SYMPOSIUM 2017

8th March 2017, Grand Copthorne Singapore

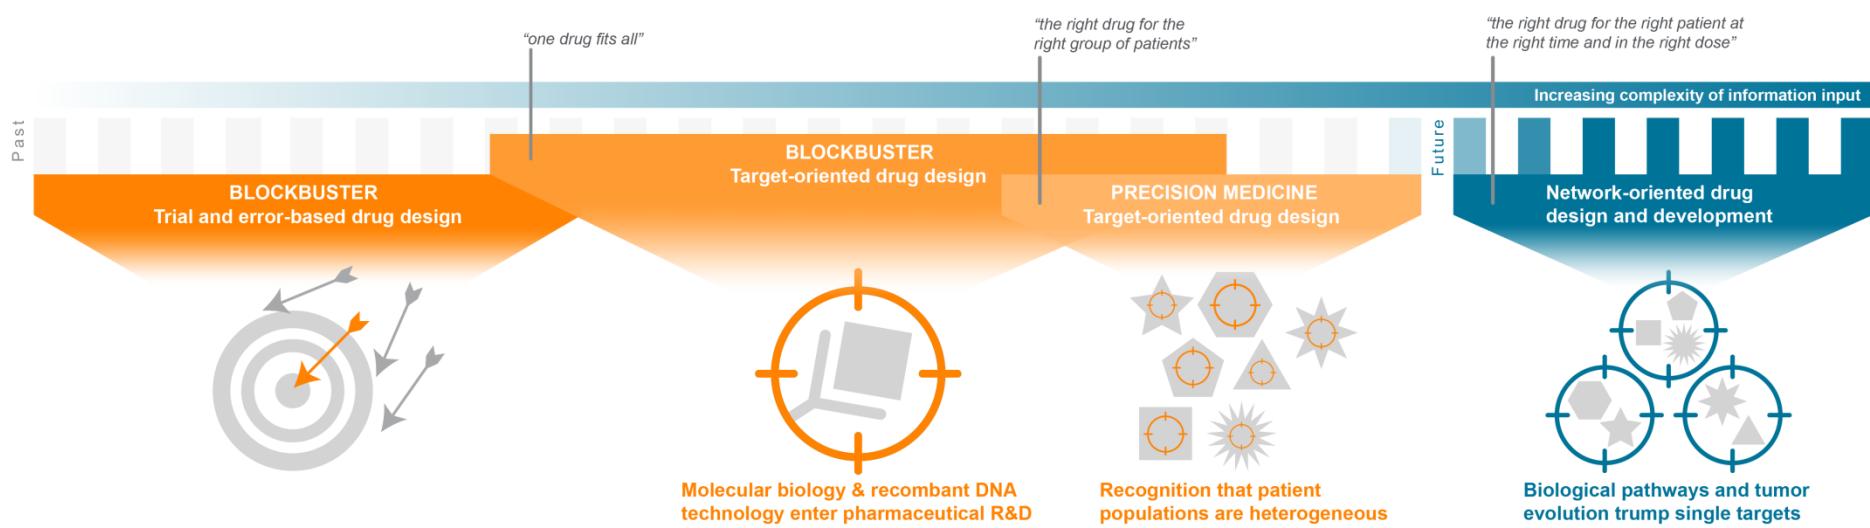

SGH – Surgery

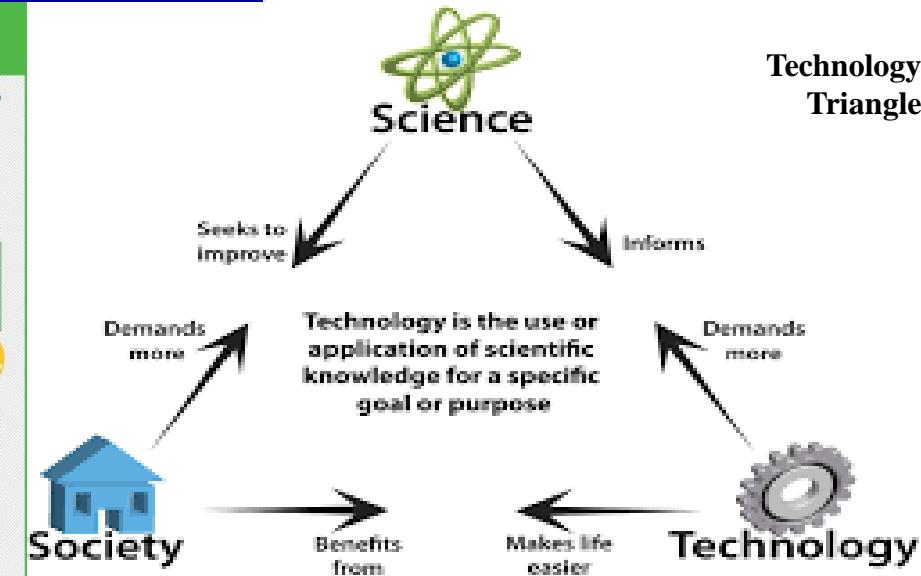

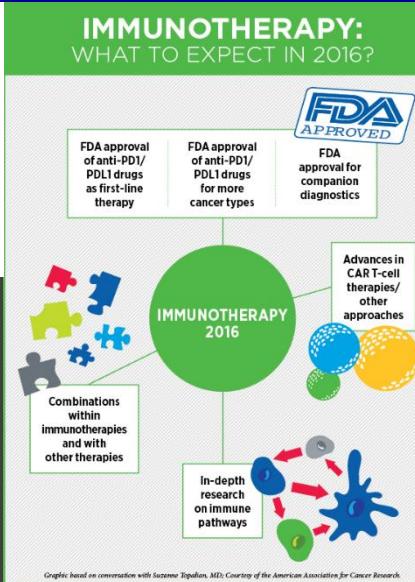

Opportunities and Challenges

- We are in a *fortunate era* in medical history
- In slightly more than a single generation, medicine has evolved from an (mostly) *intuitive art* to *empirical science* to (almost) *precision medicine*

A Vastly Changing Landscape

- Advances in the recent 2 decades not been only in Biomedical Science but also in the: *physical, computational, behavioral and social sciences.*
- These sciences have integrated

Transformation

- Concurrent advances in the sciences have transformed the nature of the **biomedical landscape** and impact:
 - on the way biomedical research is conducted and funded
 - on the evolving role of the clinician scientist

Will be challenging for traditionally structured research programs to adapt

How we learnt to do research

Hypothesis-driven paradigm

**Research carried out by
PI / small research group**

- Single discipline
- Single laboratory
- Single institution

Hypothesis

Biological question

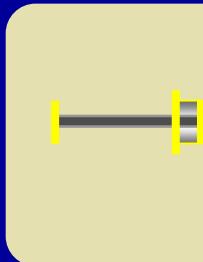

- Hypotheses come from hunches and educated guesses
- The research seeks to establish Cause and Effect
- Experiments are designed to validate hypotheses

Hypothesis Driven Research in Liver Cancer

chalcone, 2,2'-dihydroxychalcone could induce G2/M arrest then apoptosis of the cancer cells.

clusions An analysis of structure-activity relationship showed that following structures are required for their inhibitory potencies on human liver cancer cells: (1) the sub-classes of the polyphenols tested, the unique back-bone structure of chalcones with an open C-ring; (2) within chalcone group, hydroxyl substitution at 2'-carbon of ring; (3) hydroxyl substitution at 3'-carbon in B-ring of ones. However, some other structures were found to ease their potencies: e.g. substitutions by sugar moieties in flavones. These data are valuable for design and identification of new polyphenols, which could be potential proliferative agents of cancer cells.

words Plant polyphenols · Liver cancer · cancer activity: apoptosis · G2/M arrest · 2,2'-dihydroxychalcone

Introduction

Background & Aims: Hepatocellular carcinoma (HCC) is the third leading cause of cancer death. Although sorafenib has been shown to improve survival of patients with advanced HCC, this improvement is modest and patients eventually have refractory disease. This study aims at investigating the antitumor, antian-

Introduction

HCC is the fifth most common malignancy and the third leading cause of cancer-related mortality globally [1]. More than 80% of HCCs are discovered late in stage when surgery is not an option compared to the first two groups with IC₅₀ ranges of 0.1 to >400, 131 to >400, 138 to >400 and 360.85 to >400 µM,

otherapy has still been an important treatment modality for cancers. However, toxicity and poor tolerance to current chemotherapeutic drugs are dose-limiting factors. This led to a rising interest in developing anticancer drugs from relatively non-toxic sources. Plant polyphenols are one such example. They are relatively non-toxic natural products [1] found in normal diets [2] and herb medicines

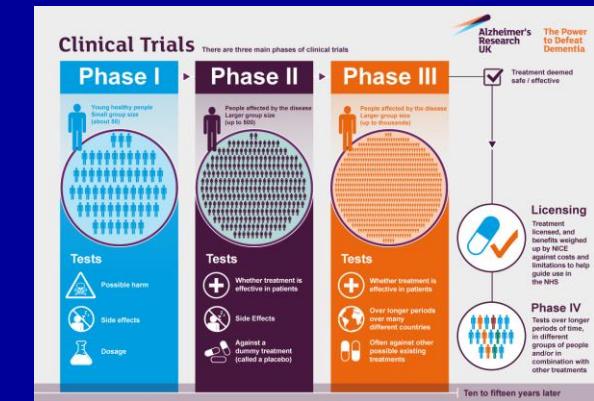

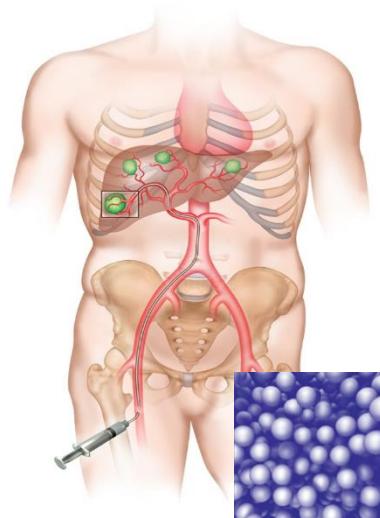

SGH

How we do Clinical Trials

Hypothesis-driven paradigm

- Conventional Phase III trials:
 - Study therapy versus comparator
 - Null-hypothesis
 - Heterogeneous populations
 - Not selected on the basis of mechanisms/biomarkers
 - Depends on measuring statistical differences to elucidate meaning
 - Large number of patients require

AHCC06 : SIRT versus Sorafenib in patients with locally advanced HCC (SirveNIB)

Phase III, open-label,
randomised-controlled study

Eligibility criteria

- Locally advanced HCC
- Child–Pugh ≤7 pts
- ECOG PS 0 – 1

Exclusion criteria

- Distant metastases
- Main portal vein thrombosis

Randomisation
1:1
(n=360)

Stratify by:
1) Site
2) Branch PVT

Sorafenib®
400mg b.i.d.

SIRT

Endpoints

Primary

- OS

Secondary

- Progression Free Survival in Liver
- Progression Free Survival at any Site
- Tumour Response Rate (liver ± any site)
- Toxicity and Safety
- Quality of Life
- Liver Resection Rate
- Liver Transplantation Rate
- Time to Disease Progression

ECOG PS = Eastern Cooperative Oncology Group Performance Status

OS = overall survival; TTP = time to tumour progression

A phase III multi-center open-label randomized controlled trial that compares the efficacy of two therapies (SIRT versus Sorafenib) in the management of locally advanced hepatocellular carcinoma. 23 sites, 11 countries

“Big Science” - Human Genome Project

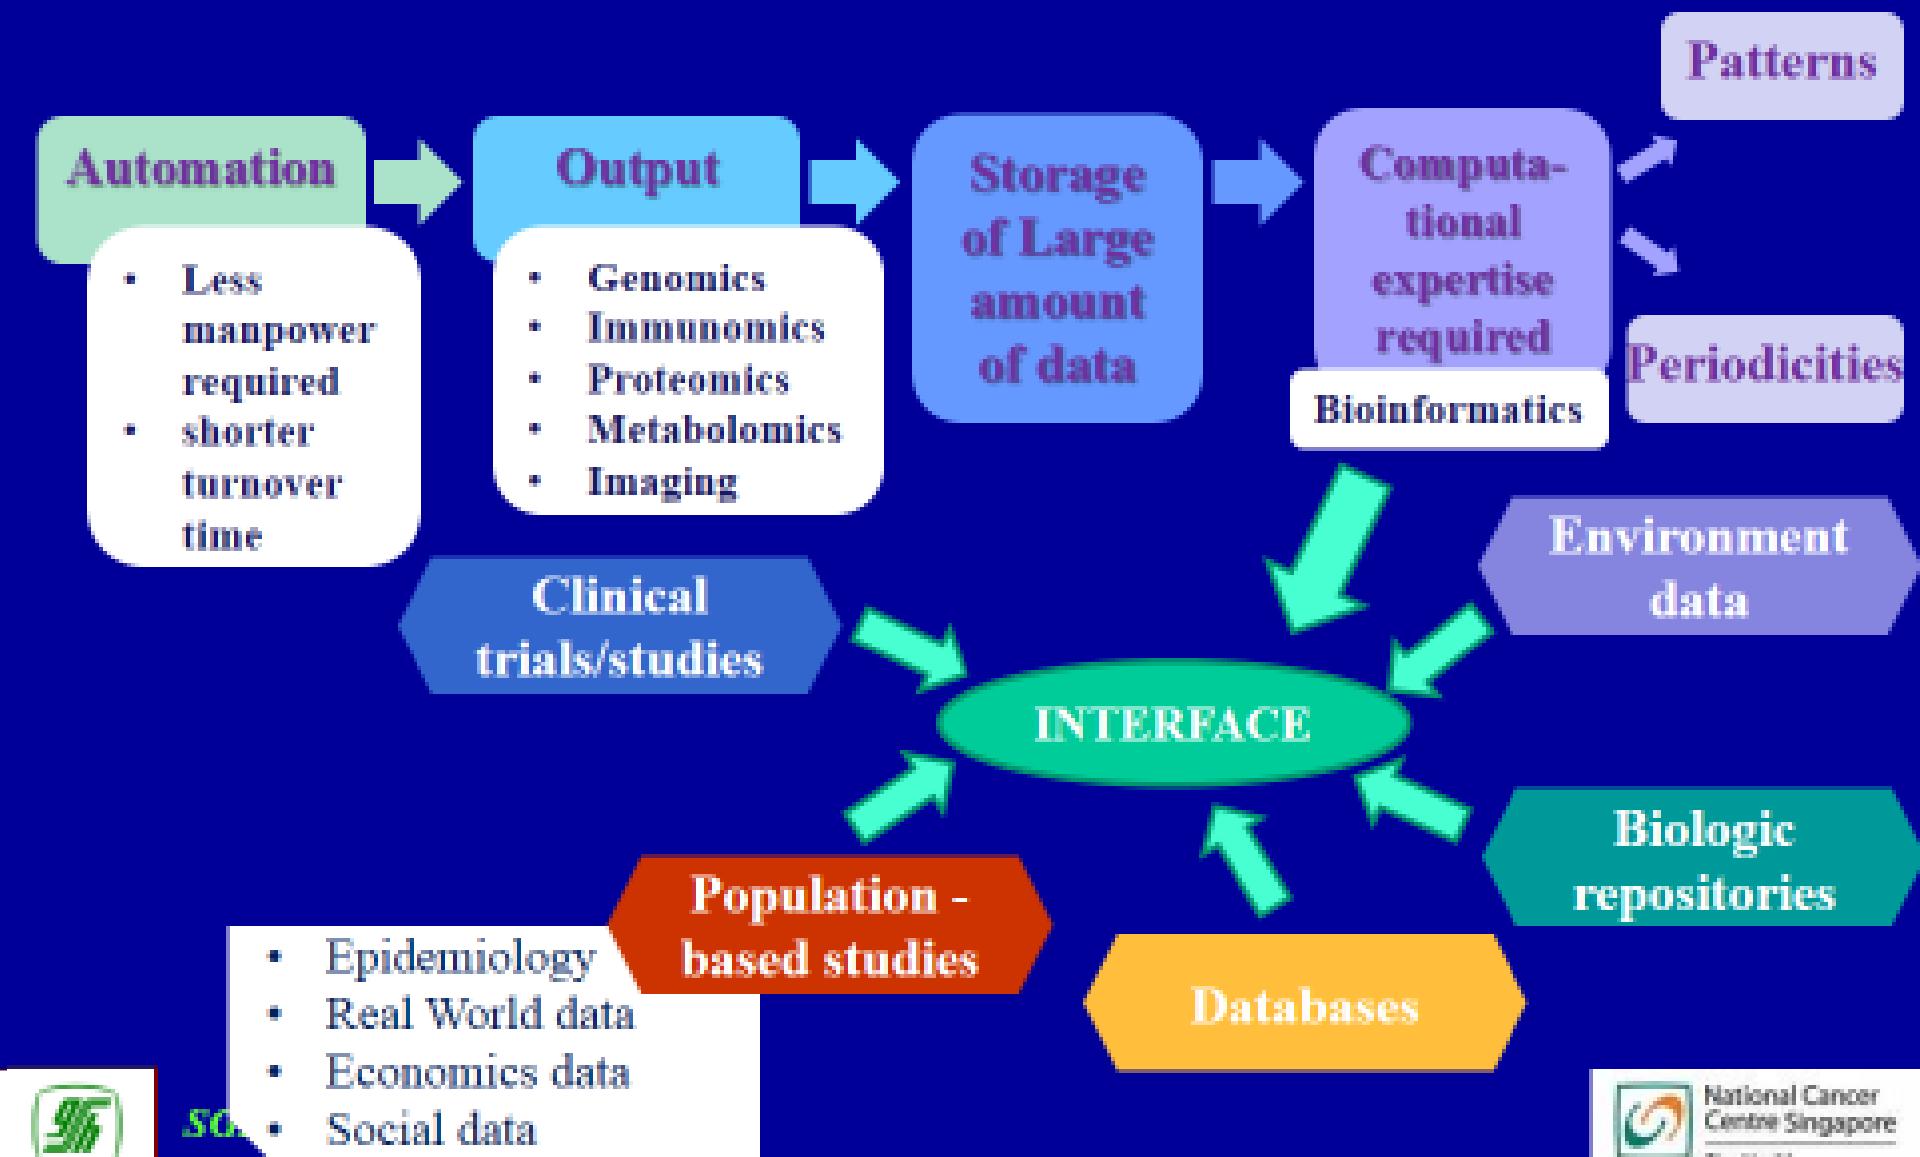

How do we transform the massive amount of information generated to biologically-meaningful discoveries?

- ↳ Function of genes
- ↳ Regulatory dynamics of cells
- ↳ Structural genomics
- ↳ Proteomics
- ↳ Population-based studies
 - Epidemiology
 - Genotypic data
 - Phenotypic data

The Impact of Technology on Biomedical Research

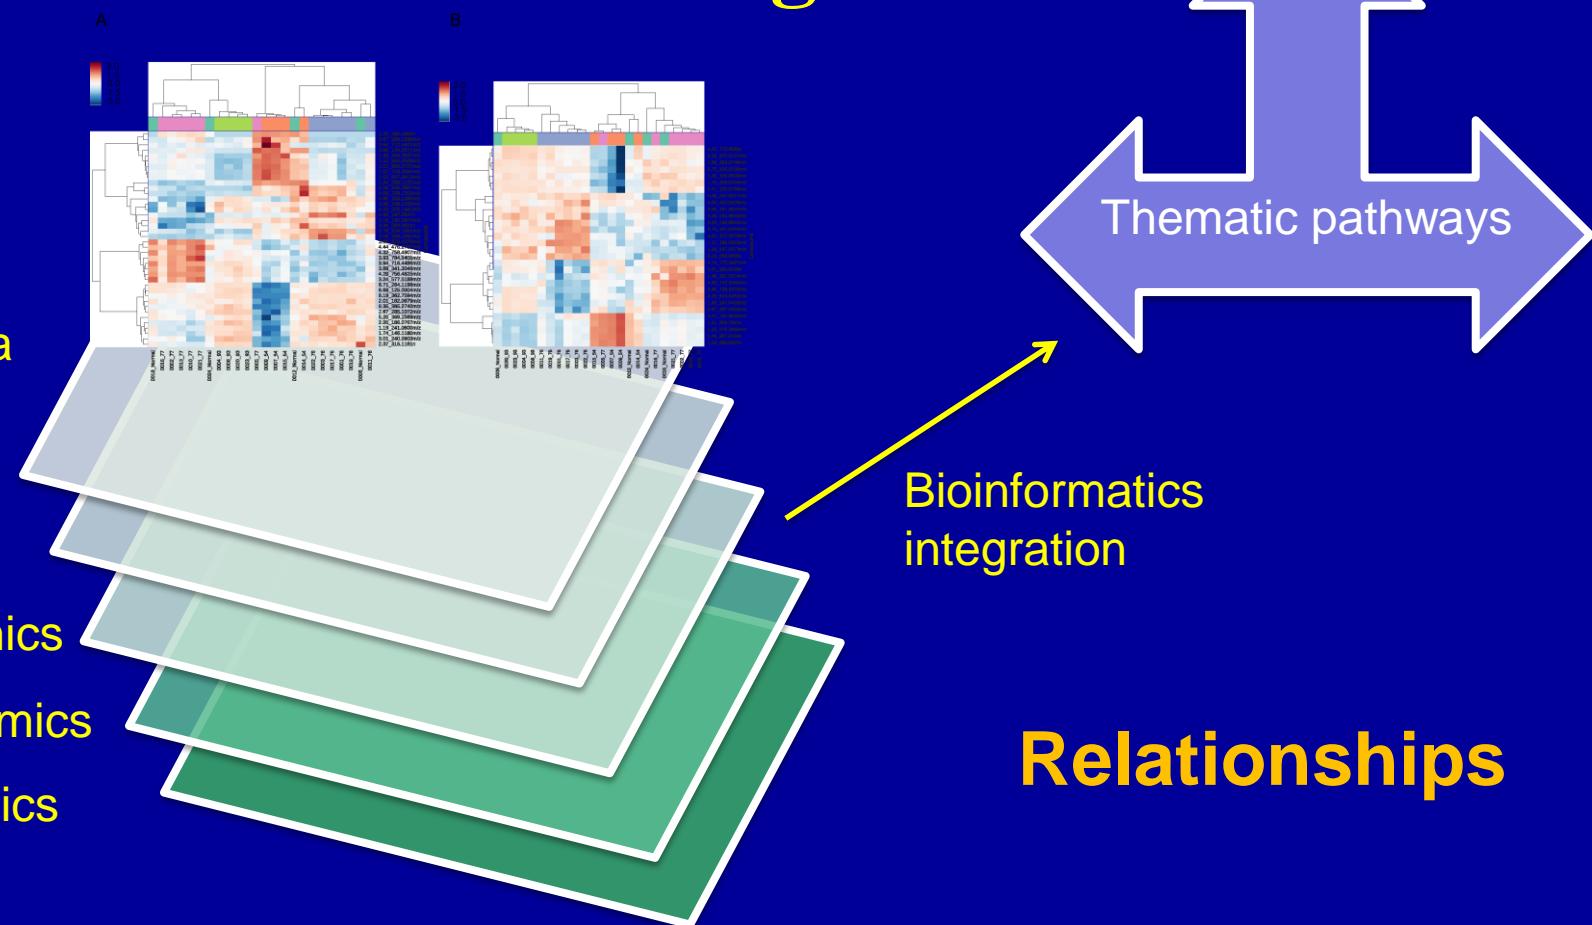

Biology is becoming an Information Science

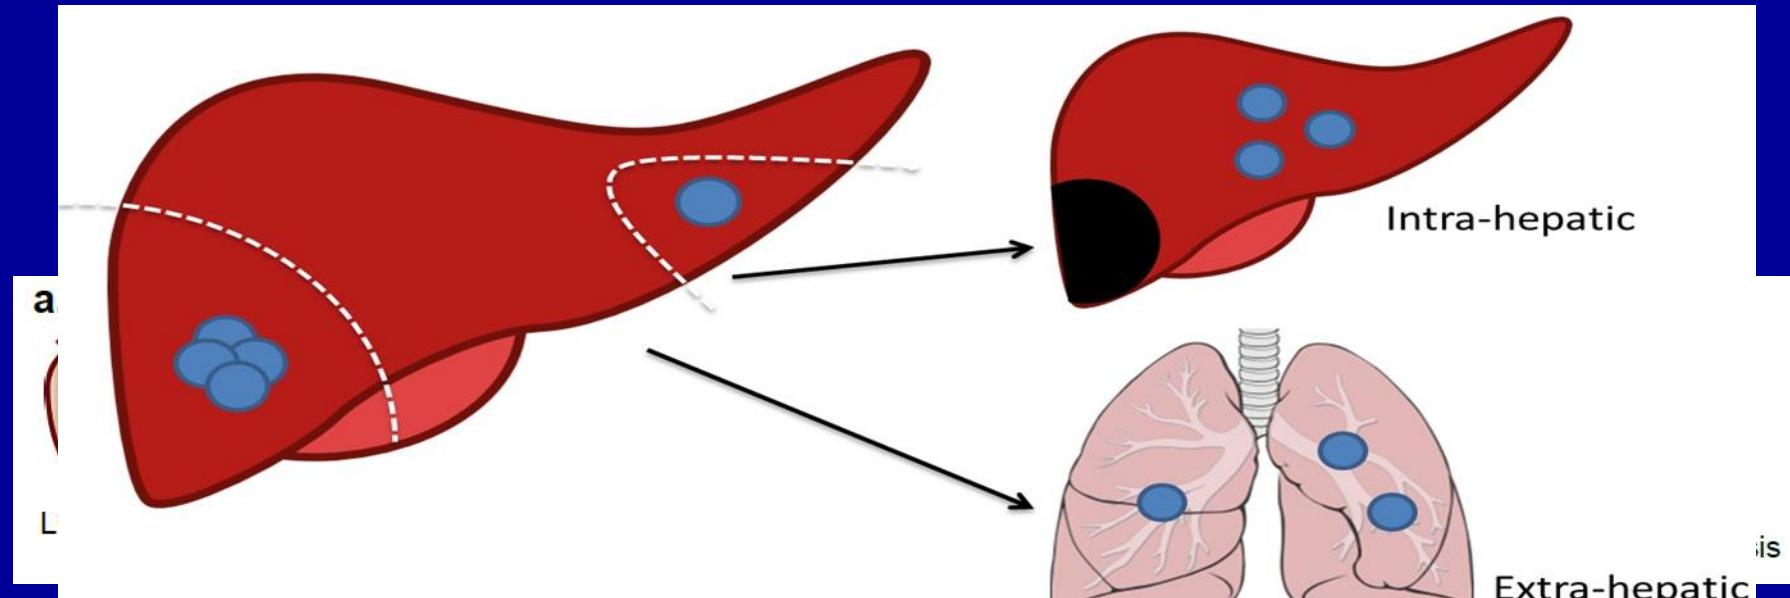

Big Data Approach

Vertical integration

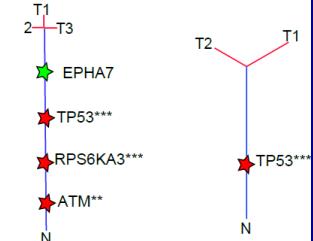

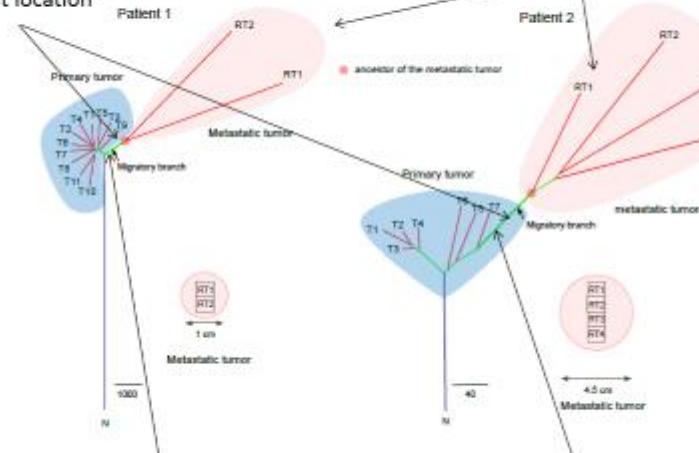

Integration of Data from the same patient/sample

Genomics of Intra-hepatic distant metastases in HCC

Very short migratory branches
Indicating very little adaption required
at the distant location

Very high genetic
variability in metastases

Before the genetic diversification of the primary tumor (connects to the trunk)

After the genetic diversification of the primary tumor (connects to the branch)

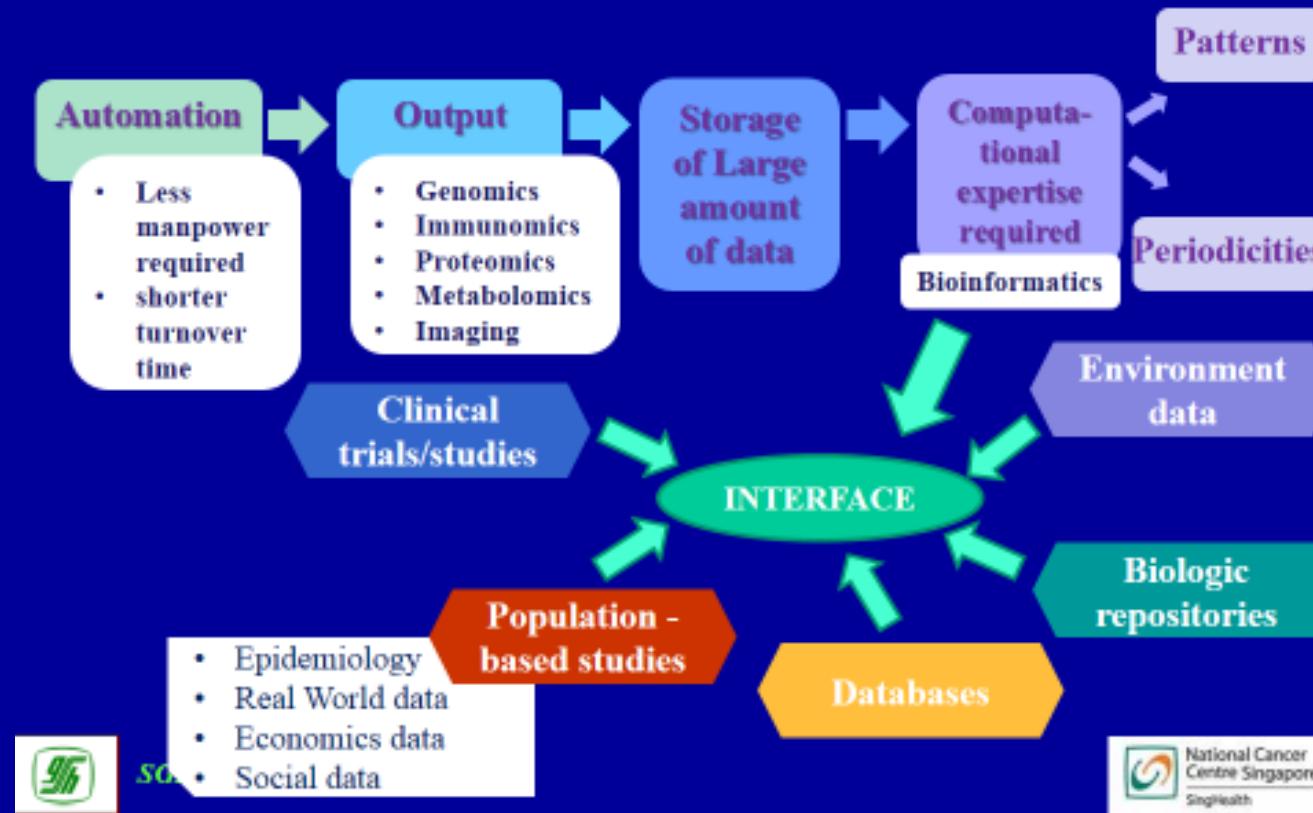

Immunomics-genomics integration in HCC

Metabolomics-genomics integration in HCC

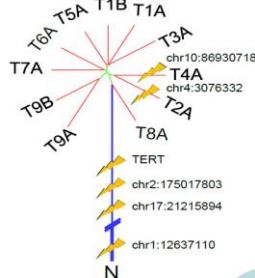

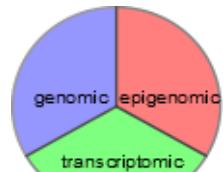

Vertical and Temporal Integration

LONGITUDINAL CLINICAL COHORT

Vertical and Temporal Integration TCR Flagship Program in Liver Cancer

Theme 1 Heterogeneity

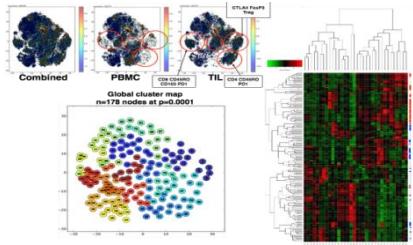

Phase 1: 100/250 patients, 5/15 Asia-Pac centers

Pre-op scans, bloods, multi-region tissue samples, cfDNA, CTC

Surgical Resection

Theme 2 Translational Immunomics

AIMS:

To meet the pressing need for **efficacious drugs** in HCC
To bring **Precision Medicine** to patients with HCC

Theme 3: Clinical Trajectory and Translational Clinical Trial

Neo-Adjuvant/Adjuvant Therapy Trial

3-monthly follow-up:
scans, bloods, cfDNA, CTC
Creation of representative pre-clinical models

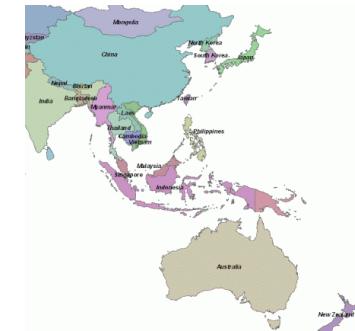

Recurrence
Biopsy or resection tissue samples, cfDNA, CTC

Phase 2:

Therapeutics selected on the basis of discoveries in this study

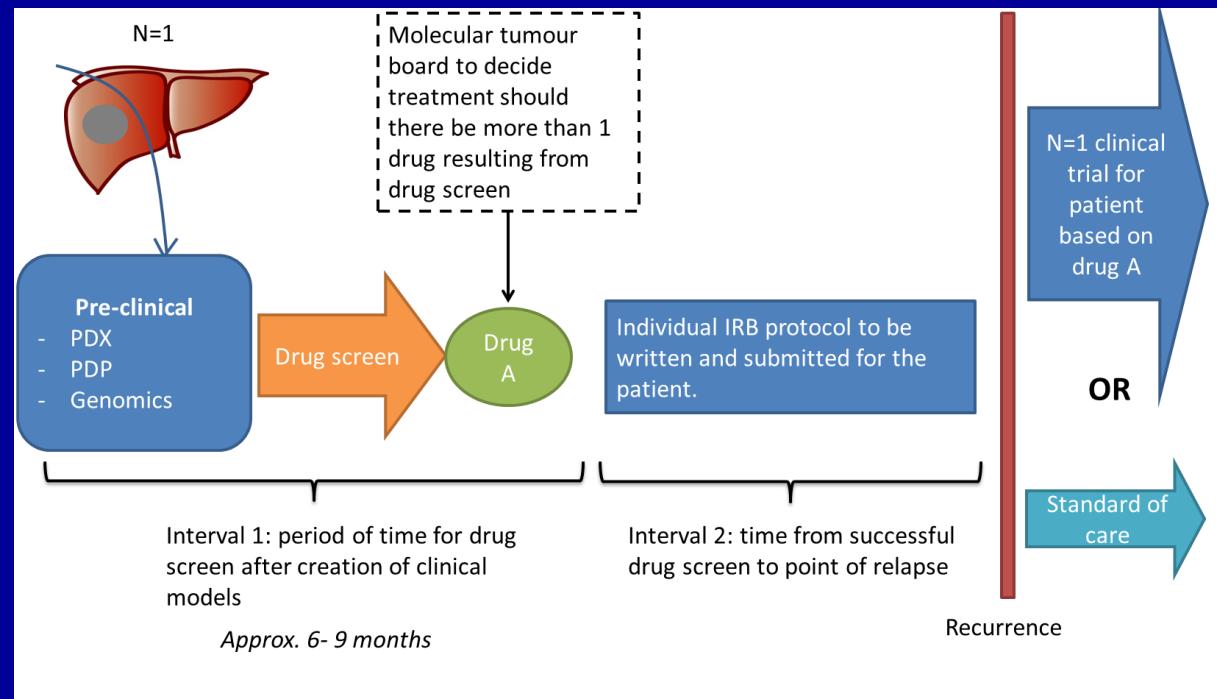

Asia-Pacific HCC Trials Group

Precision Medicine in Liver Cancer Asia-Pacific Network

The Changing Face of Clinical Trials

- **Target enriched clinical trials**
 - Biomarker selection
 - Drug panels
 - Possible to have N-of-1 trials
- **Patients shortlisted from**
 - Biological Databases
 - Electronic Medical Records (EMR)

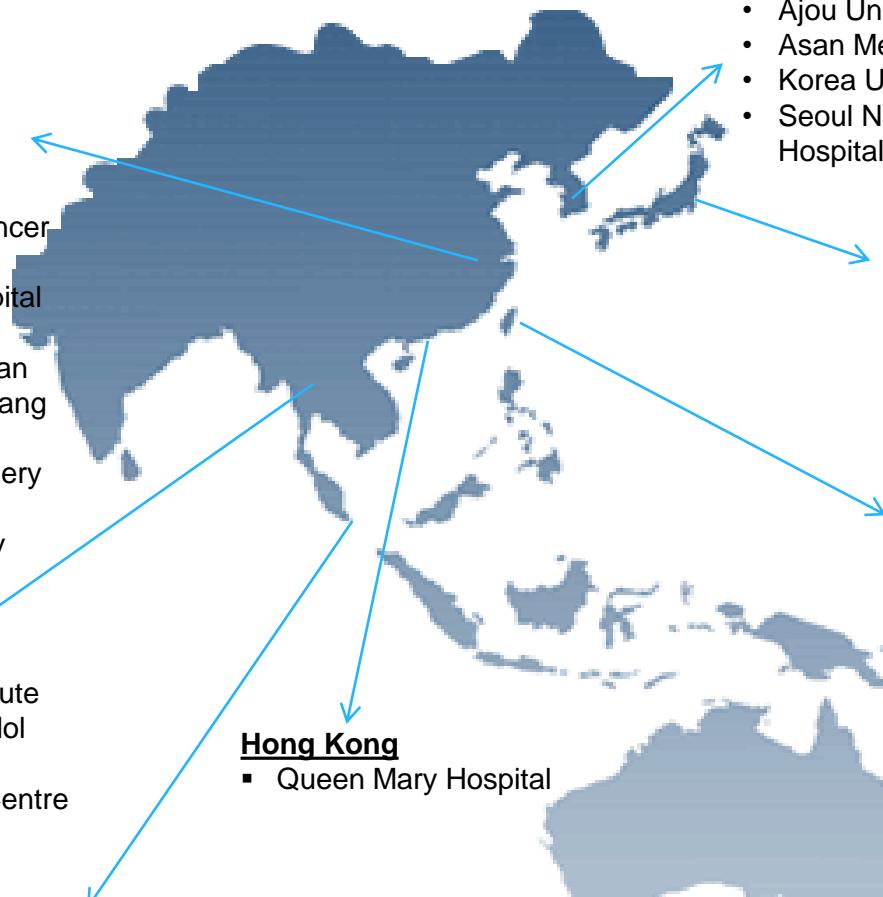

N=1 Clinical Trial for Liver Cancer

From Hypothesis-Driven to Discovery-Driven Science

Still very important : Hypothesis-driven Science

Large Funds : Discovery-driven science

Assumption: Analysis of complete data across the breadth of a disease

Large scale:

- *Multi-discipline*
- *Multi-institution*
- *Multi-national*

SGH – Surgery

Increasing Recognition of the Need for Inter-disciplinary Research

Major Diseases

- Multi-faceted
- Share risk factors with other diseases
- Multiple etiologies e.g. diabetes mellitus, HCC

Requires

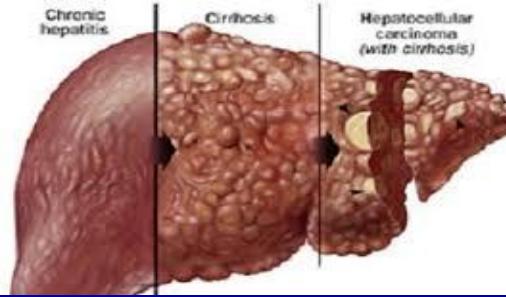

- Broad-based
- Large scale
- Trans-institutional

Challenges

(for single PI/small group)

1. No single lab has sufficient breadth
2. Logistically challenging coordination of large multi-institutional projects
3. Technology resides in different intuitions

Needed

New breed of interdisciplinary
CLINICIAN SCIENTIST

Increasing Public-Industry Collaborations

- With increasing complexity of research, **industry** rarely have access to all the necessary expertise
- Academia** however does not manufacture therapeutics

Neoadjuvant Study with Drug A

A clinico-immunomics-genomics correlative study in liver cancer

Industry-sponsored by big pharma

Patients scheduled for liver resection in 5-6 weeks

Screening Visit

(5-6 wks before scheduled surgery)

- Pre-treatment CT/MRI
- Peripheral blood

Given Informed Consent

Baseline Visit (Day 1)

(4 wks before scheduled surgery)
Treated with X cycle of Drug A

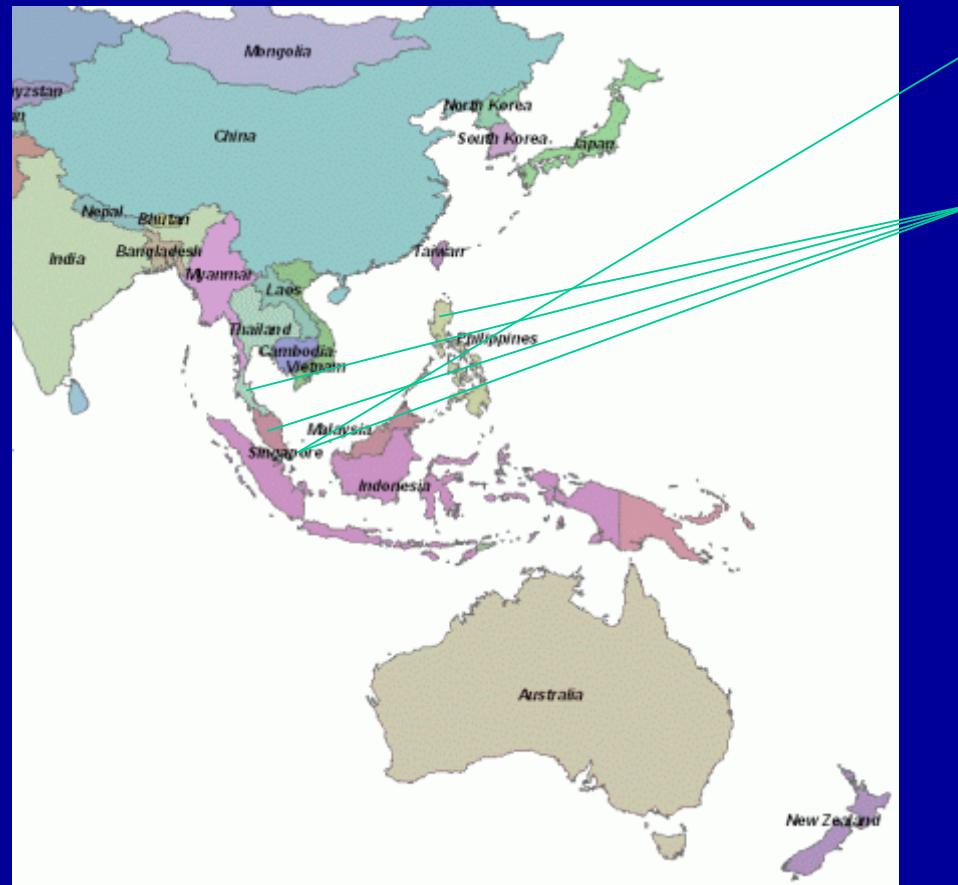

Washout
(1 wk before surgery)

Surgery

- Resected tumor and normal tissues
- Peripheral blood

Adjuvant Study with Drug A
(5-6 wks post-surgery)

Increasing importance of International Collaborations in Biomedical Research

- The multi-ethnic Asia-Pacific HCC Network allows access to all the important **etiological** and **ethnic** variations in HCC.
- Competitive Advantage over competitors China/Korea/Japan where cohorts will be overwhelmingly **mono-ethnic** and of **single etiology**

Challenges and Opportunities in A Changing Biomedical Research Landscape

Challenges

- The ascendency of Discovery-driven funding
- Need for large scale collaborative studies
- Need for inter-disciplinary collaborations
- Increasing Public-Private collaborations
- Increasing international research collaborations

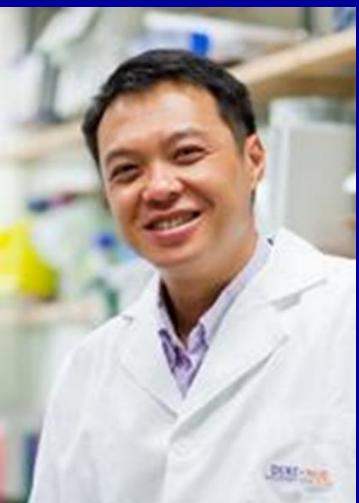

Opportunities

- The evolution of a new breed of **uber** inter-disciplinary clinician-scientists

SGH – Surgery

Its going to be cool to be a clinician –scientist
