

Advancing Precision Medicine for Diabetes and Cardiovascular disease

Prof John Chambers

Professor of Cardiovascular Epidemiology,
Lee Kong Chian School of Medicine, Nanyang Technological University

Chief Scientific Officer, PRECISE
PI, SG100K Study

Diabetes: the \$1Trillion disease paradigm

Importance

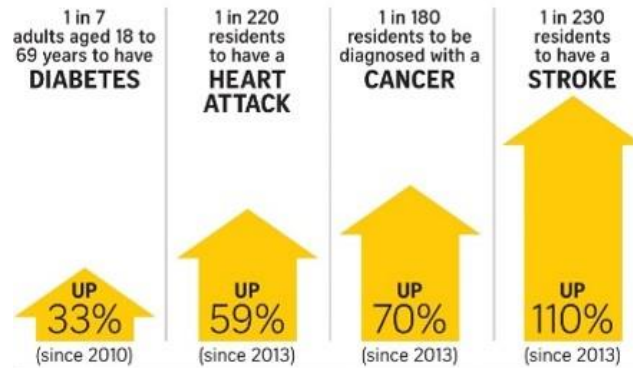

- Lifelong condition
- Affects 1/11 adults globally
- Multiple complications
- ~\$988 billion 2021

Motivation

Importance of T2D in Singapore

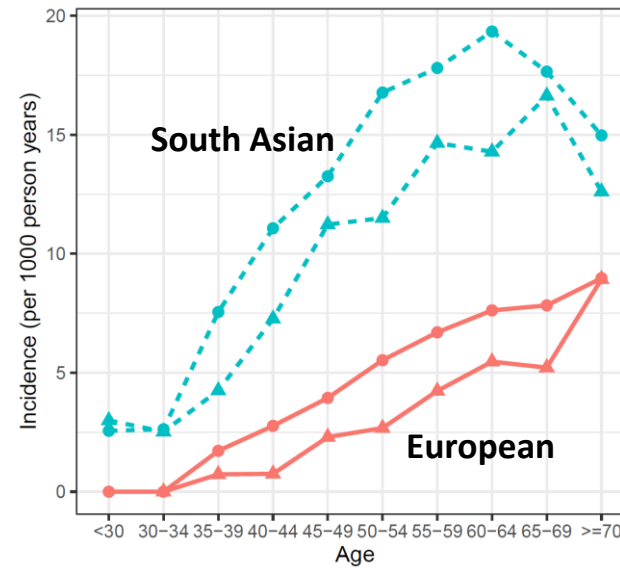

Diseases on the rise due to ageing population

Estimated numbers by 2030

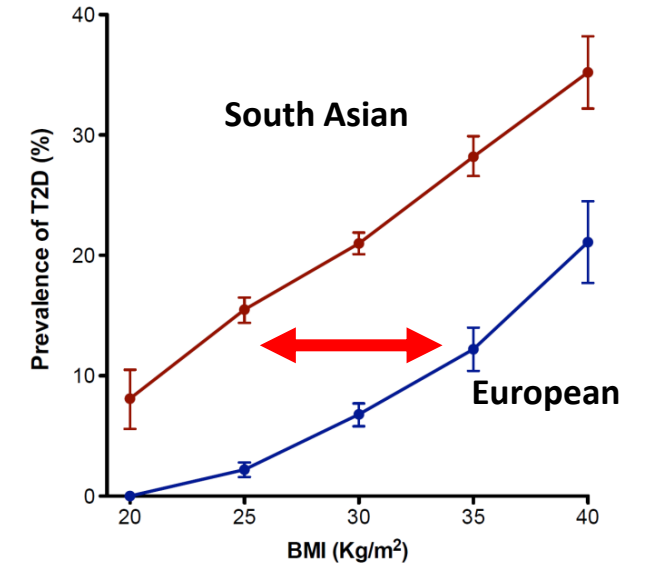

Source: MINISTRY OF HEALTH SUNDAY TIMES GRAPHICS

Unexplained T2D susceptibility

High risk not explained by adiposity

Ethnicity

- East-Asian (red line with circles)
- South-East-Asian (green line with triangles)
- South-Asian (blue line with squares)

Progression to Diabetes

Prediabetes:
Raised HbA1c or glucose

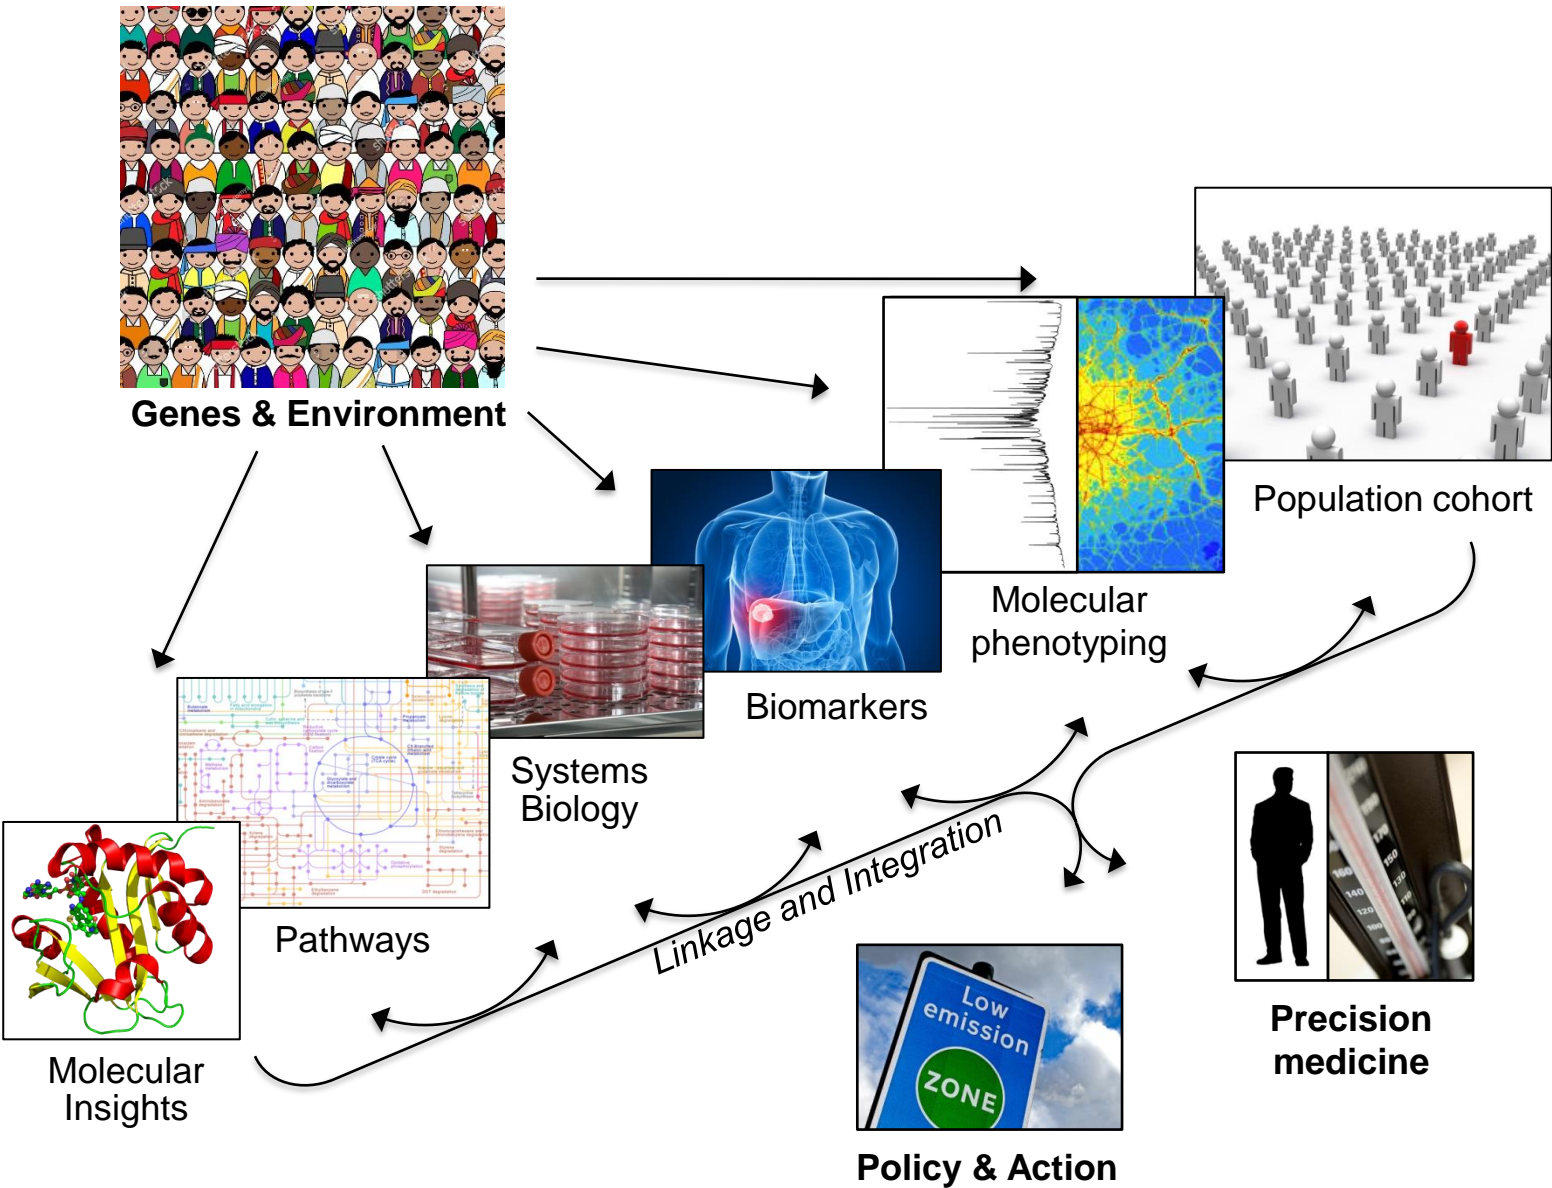

The problem with Prediabetes

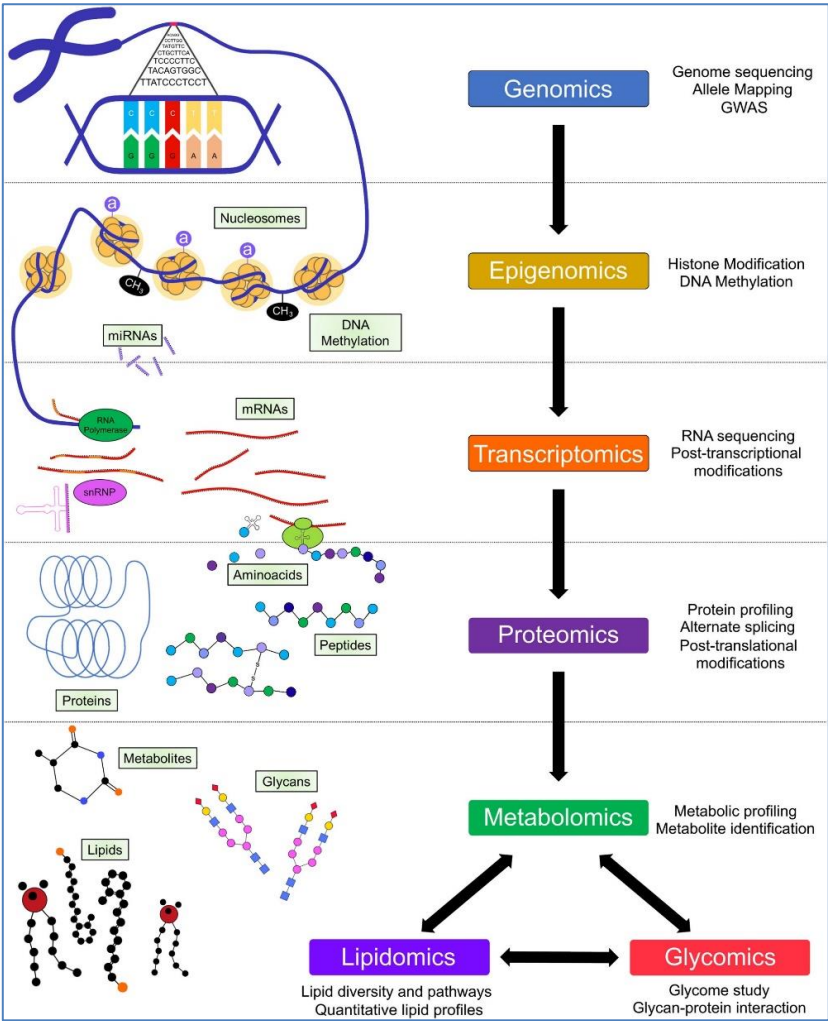

- Risk condition:
 - 2-fold increased risk of CVD
 - Microvascular disease (retinopathy, neuropathy, and nephropathy)
- High progression to T2D
 - 50% in Europeans over 10 years
 - 80% in Asians over 10 years
- Intervention modestly effective

Population Science approach

Molecular phenotyping

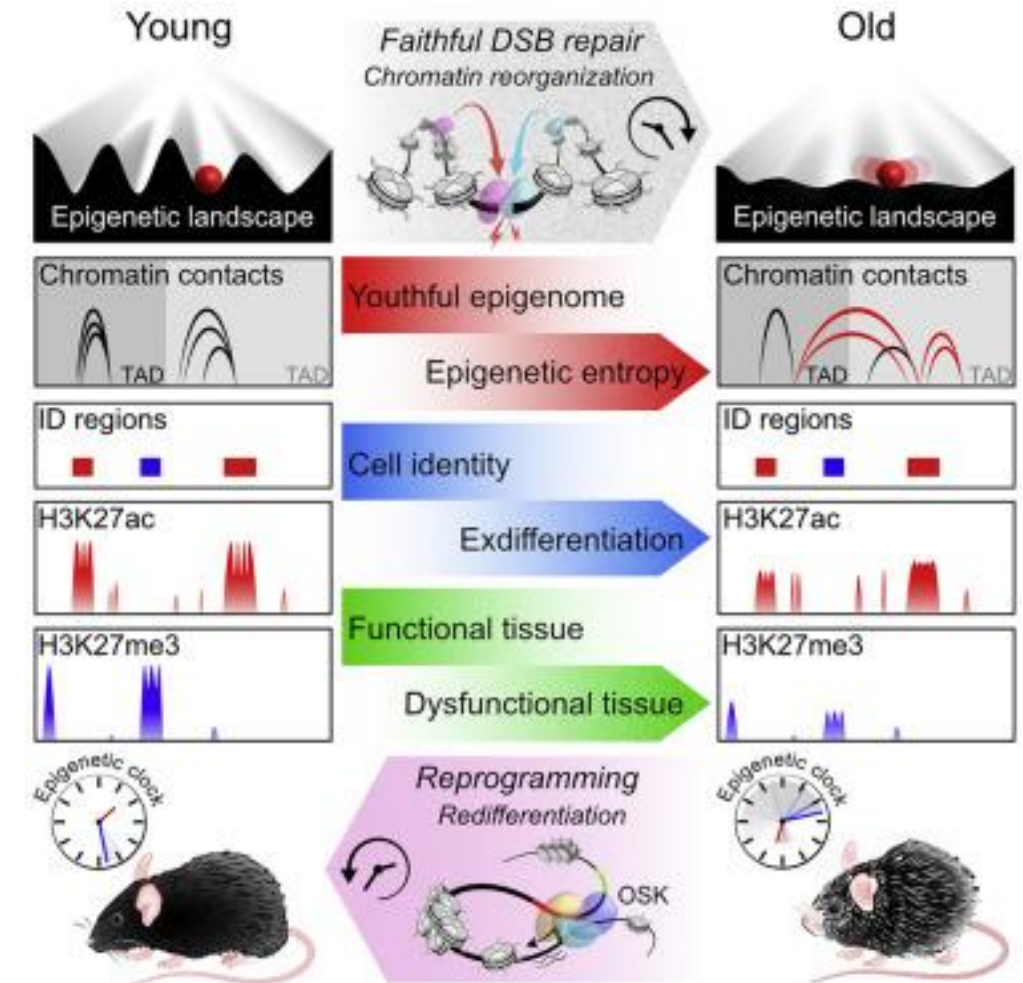

DNA methylation as a disease pathway

Cells can turn genes **on and off** by adding chemical groups to **histone proteins** or to **DNA**.

Why Methylation?

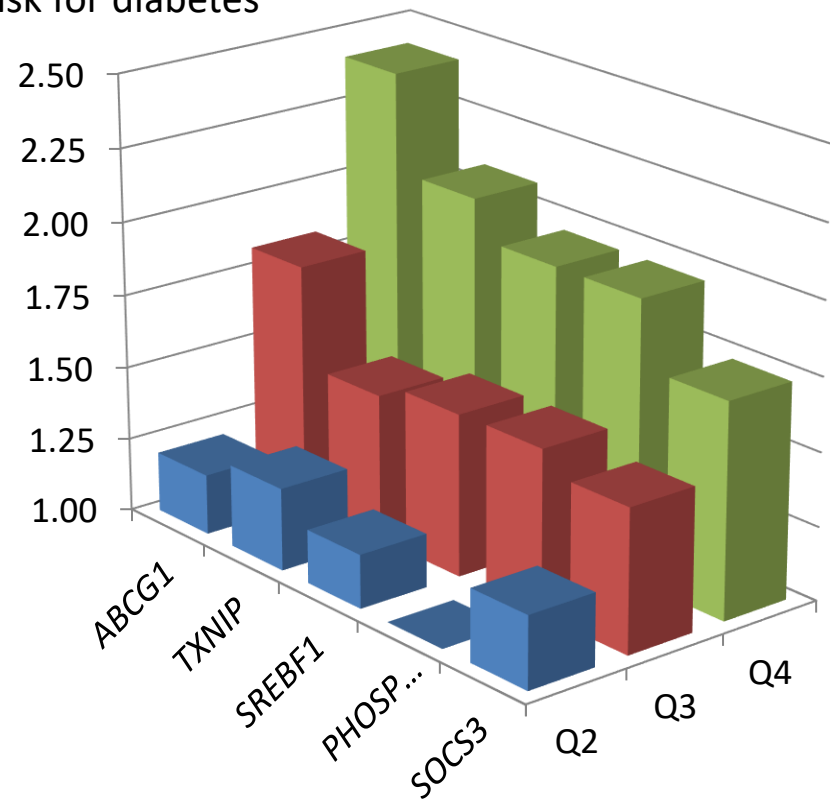

- Critical role in cellular programming and adaptation
- Proximal integration of gene, environment and behaviour
- Molecular heterogeneity: >30M CpG sites
- Implicated in chronic disease aetiology

Prior work: DNA methylation signatures for T2D

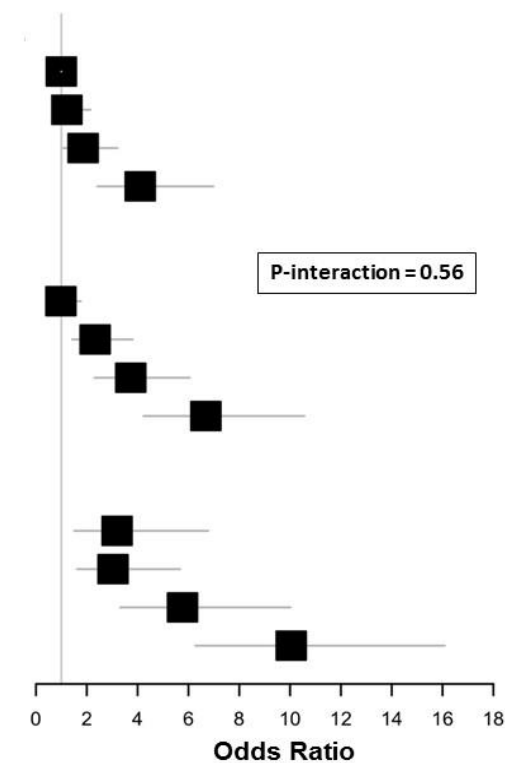

*Nested case-control study for T2D
N=2500, 450K Methylation array*

Risk for diabetes

*DNA methylation identifies
metabolically unhealthy adiposity*

Q4	149/255	7.9E-22	

Insights from resequencing: Methylation arrays assess <3% of epigenome

Programme Goals

1. Extend discovery of methylation markers predicting T2D through
 - a) Methylation array studies with larger sample size
 - b) Methylation sequencing (whole methylome and targeted)
2. Functional genomic evaluation for molecular pathways
3. Determine predictive utility for future T2D

Study Samples

- Singapore Population Health Study (SPHS)/ Multi-Ethnic Cohort (MEC)
 - Cohort of ~50,000 adult Singaporeans and long-term residents from three major ethnic groups (Chinese, Malay and Indian)
 - EPIC array; 761 incident T2D cases, 743 controls
- LOLIPOP
 - Prospective population study of South Asian men and women
 - EPIC array
 - 1,000 incident T2D cases, 1,000 controls
 - 450K array (Chambers and Loh *et al* 2015)
 - 1,074 incident T2D cases, 1,590 controls

Model: $T2D \sim \text{Beta}(QN) + \text{Age} + \text{Gender} + WBC_{\text{Houseman}} + PC1-30_{\text{ctrl-probes}} \rightarrow \text{Meta-analysis}$

-> 420 EWAS signals; 314 discrete loci

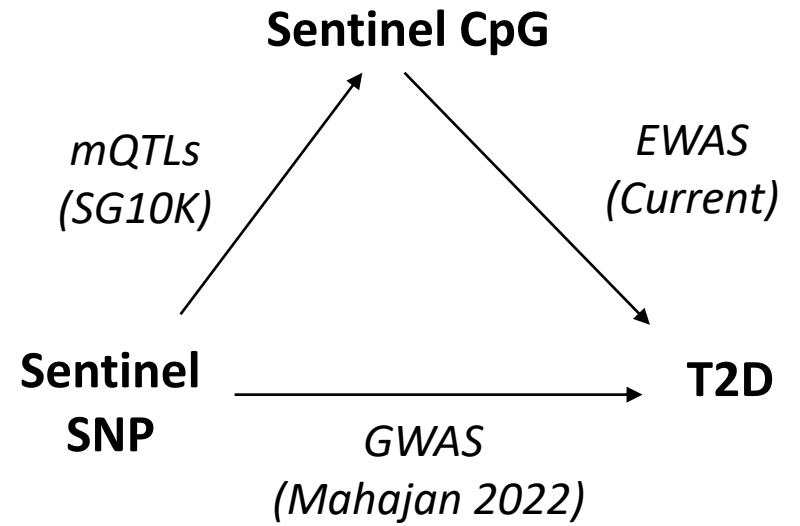

Leading associations

Marker	OR (95% CI)*	P	Chr	Position	Gene	Gene summary	Known?
cg06500161	1.18 [1.16, 1.21]	9.08E-46	chr21	43656587	ABCG1	Involved in macrophage cholesterol and phospholipids transport, and may regulate cellular lipid homeostasis	Y

*per 1% change in methylation level

Are the methylation marks involved in disease aetiology?

- 314: EWAS (meth-T2D) identifies Sentinel CpG
- SNP-CpG: Identifies Sentinel SNPs for the CpGs
- SNP-T2D: T2D GWAS result for the Sentinel SNPs
(Mahajan 2022)

Colocalization Analysis

H_0 : neither trait has a genetic association in the region

H_1 : only trait 1 has a genetic association in the region

H_2 : only trait 2 has a genetic association in the region

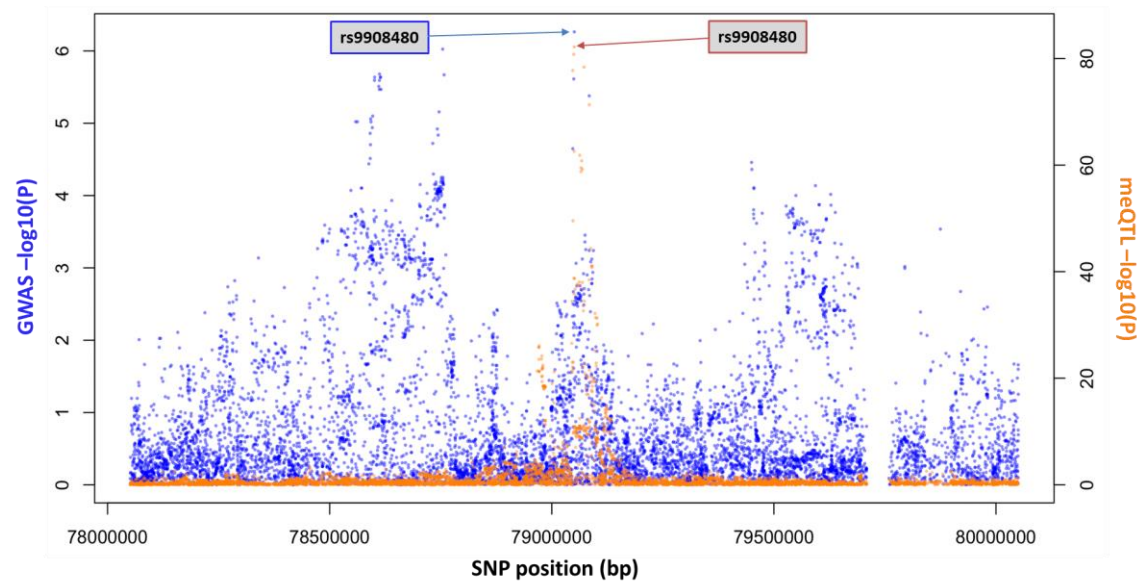

H_3 : both traits are associated, but with different causal variants

H_4 : both traits are associated and share a single causal variant

CpG	Nearest Gene	EWAS P	PP.H0.abf	PP.H1.abf	PP.H2.abf	PP.H3.abf	PP.H4.abf

BAIAP2

SMR P-value: 1.55E-06;
Posterior Probability of Colocalization
at rs9908480 = **0.992**

NFATC2IP

SMR P-value: 2.28E-05;
Posterior Probability of Colocalization
at rs12449272 = **0.987**

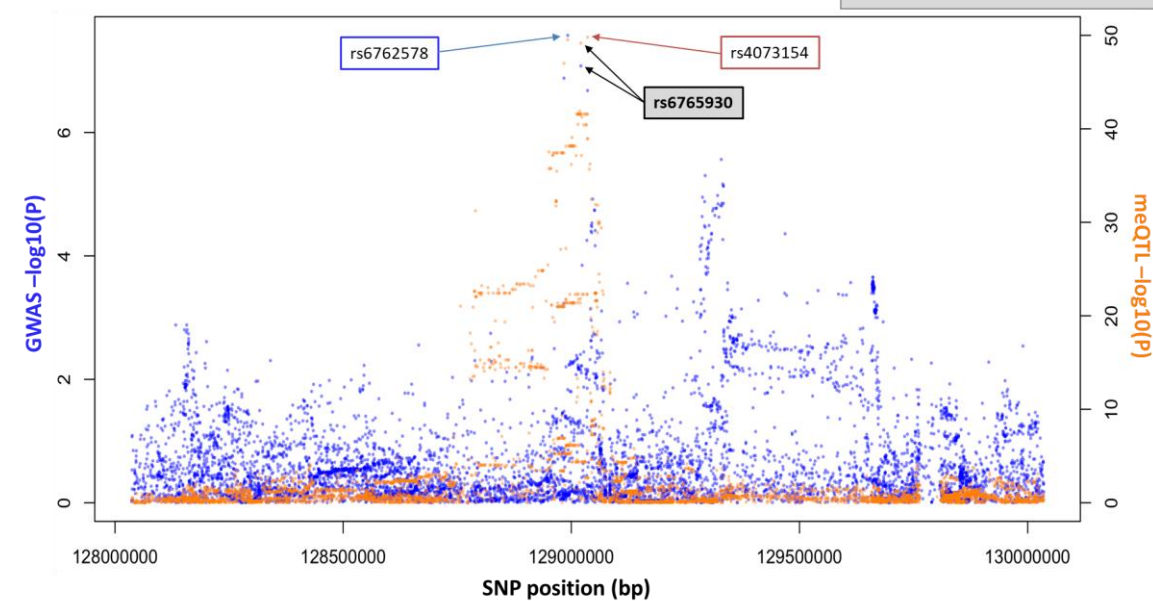

JARID2

SMR P-value: 5.06E-06;
Posterior Probability of Colocalization
at rs7769291 = **0.343**

H1-10

SMR P-value: 9.56E-07;
Posterior Probability of Colocalization
at rs6765930 = **0.725**

Plausible candidates

- *JARID2*. Involved in development of endocrine pancreas. Conditional ablation in mice impairs endocrine cell differentiation, and activation of the insulin-producing β -cell differentiation program.
- *BAIAP2* encodes the Insulin Receptor Substrate p53 (IRSp53), a target for insulin activated tyrosine kinase in the CNS. May be involved in myogenic differentiation.

Candidate genes: *cis* eQTM analyses (Methylation to Gene expression relationships)

- RNAseq N=1,200 SG samples:
 - NEBNext® Ultra™ II Directional RNA Library Prep
 - GLOBINClear for depletion of globin gene RNA and Ribosomal RNA (rRNA).
 - NovaSeq6000, paired-end run (2 x 150bp)
 - 30M aligned reads per library (~9Gb of data)
- Test 314 Sentinel CpGs for association with expression of nearest gene
- 65 genes as QTMs at $P < 0.05$ after Bonferroni correction

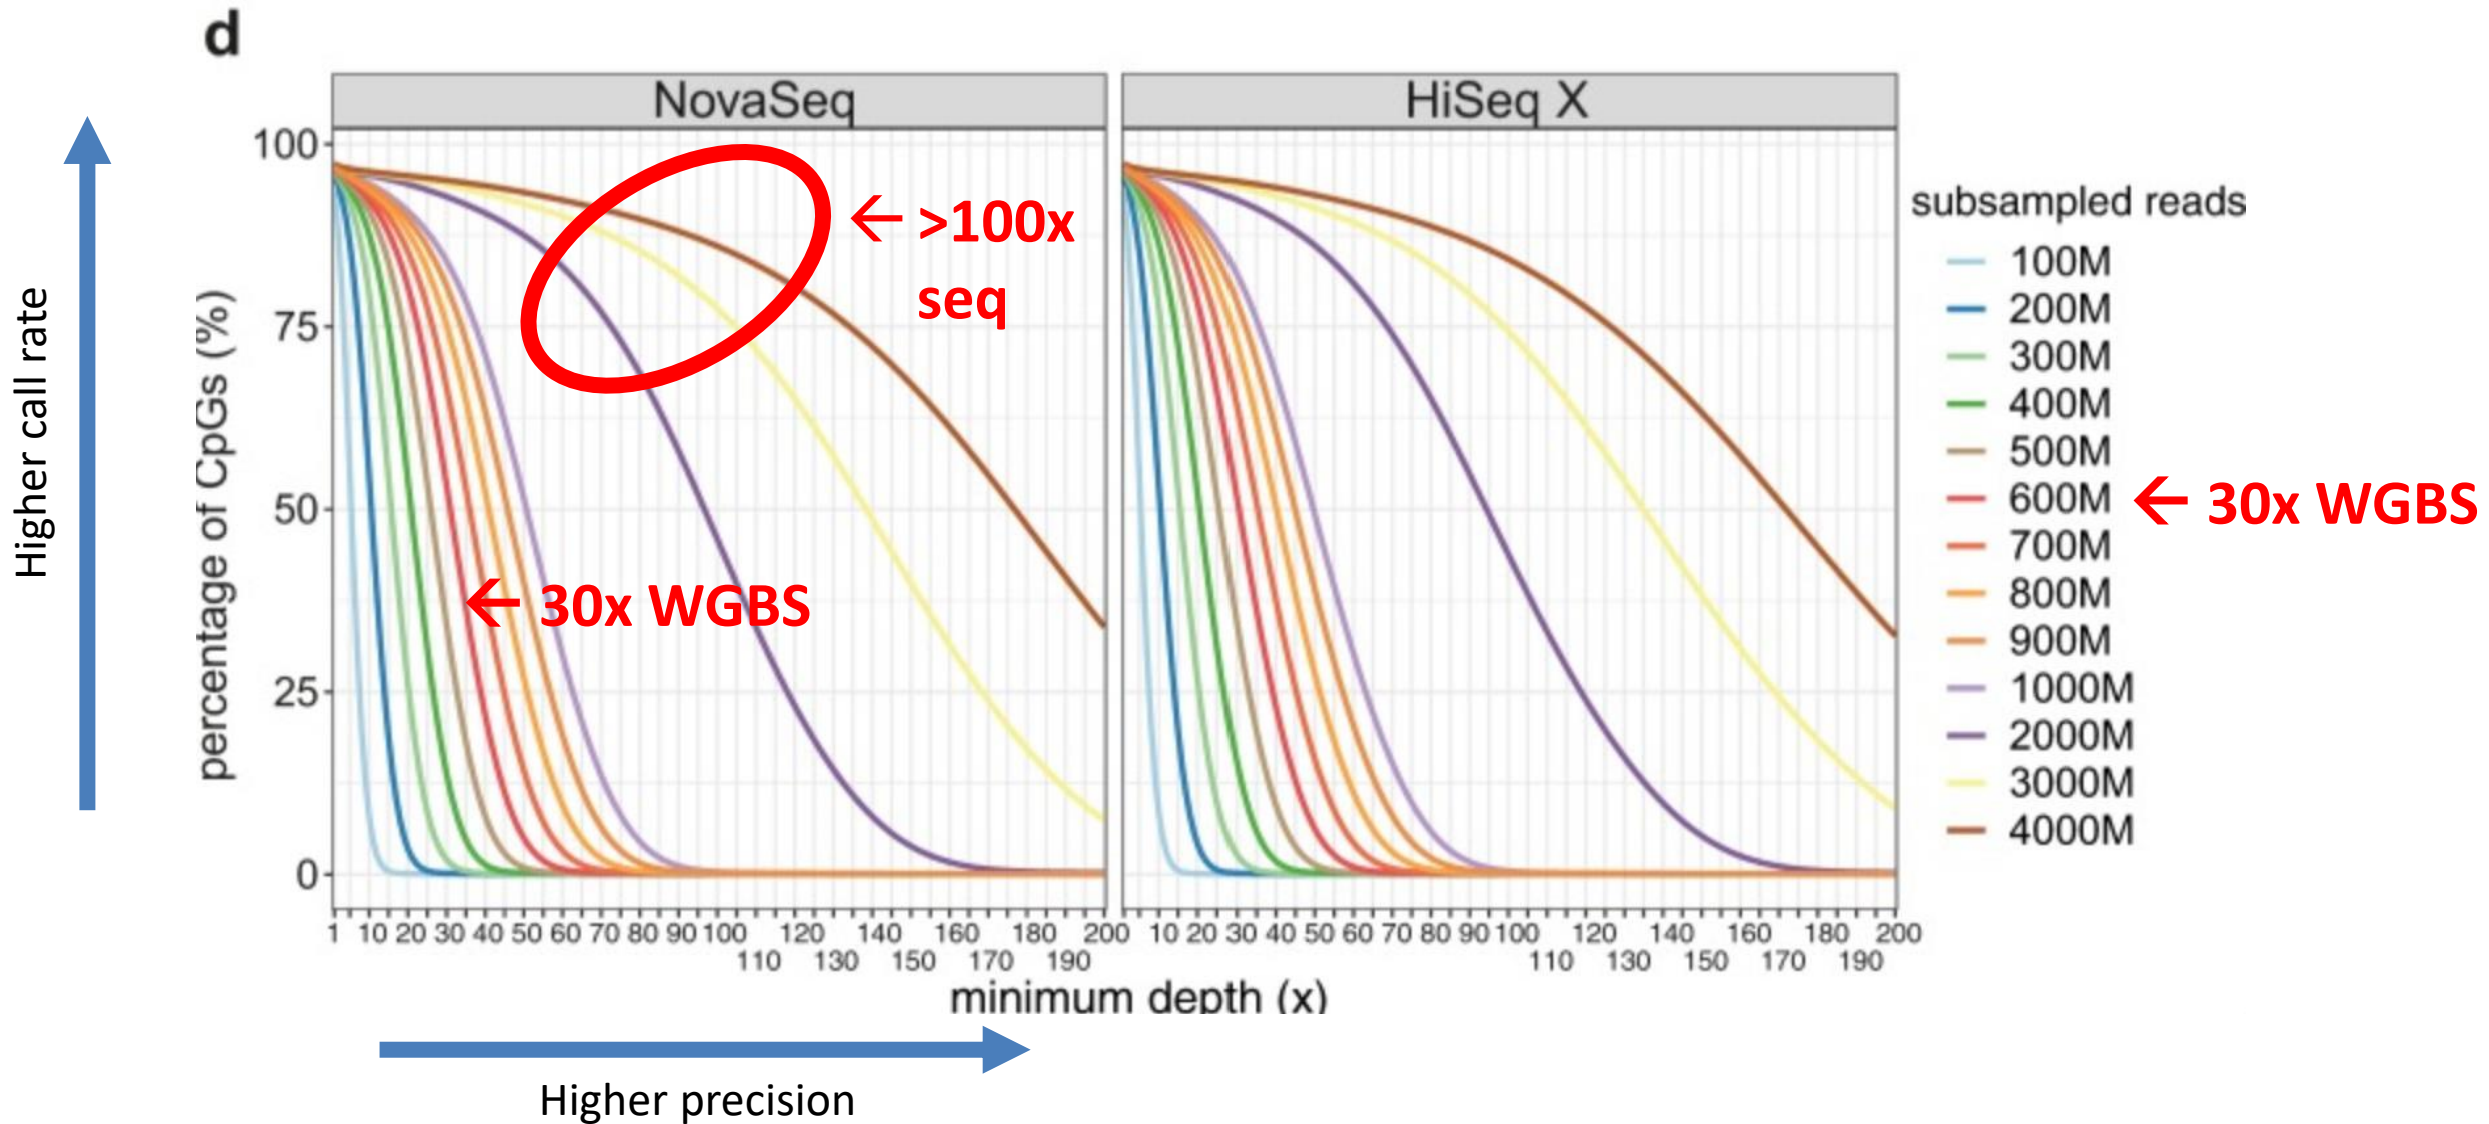

The need for resequencing: Methylation arrays assess <3% of epigenome

Whole Methylome sequencing for T2D

- 264 incident T2D cases and 286 controls
- Bisulfite conversion: EZ DNA Methylation Gold Kit (Zymo)
- Library construction: Accel-NGS[®] Methyl-Seq Kit (Swift Biosciences)
- Sequencing: Illumina[®] NovaSeq 6000 platform
- 2x150bp paired-end; target 30x coverage
- Minimum depth 5x

The problem with methylome sequencing

30x Whole methylome association results

→ No additional loci at $P < 10^{-7}$

MAE for replicates

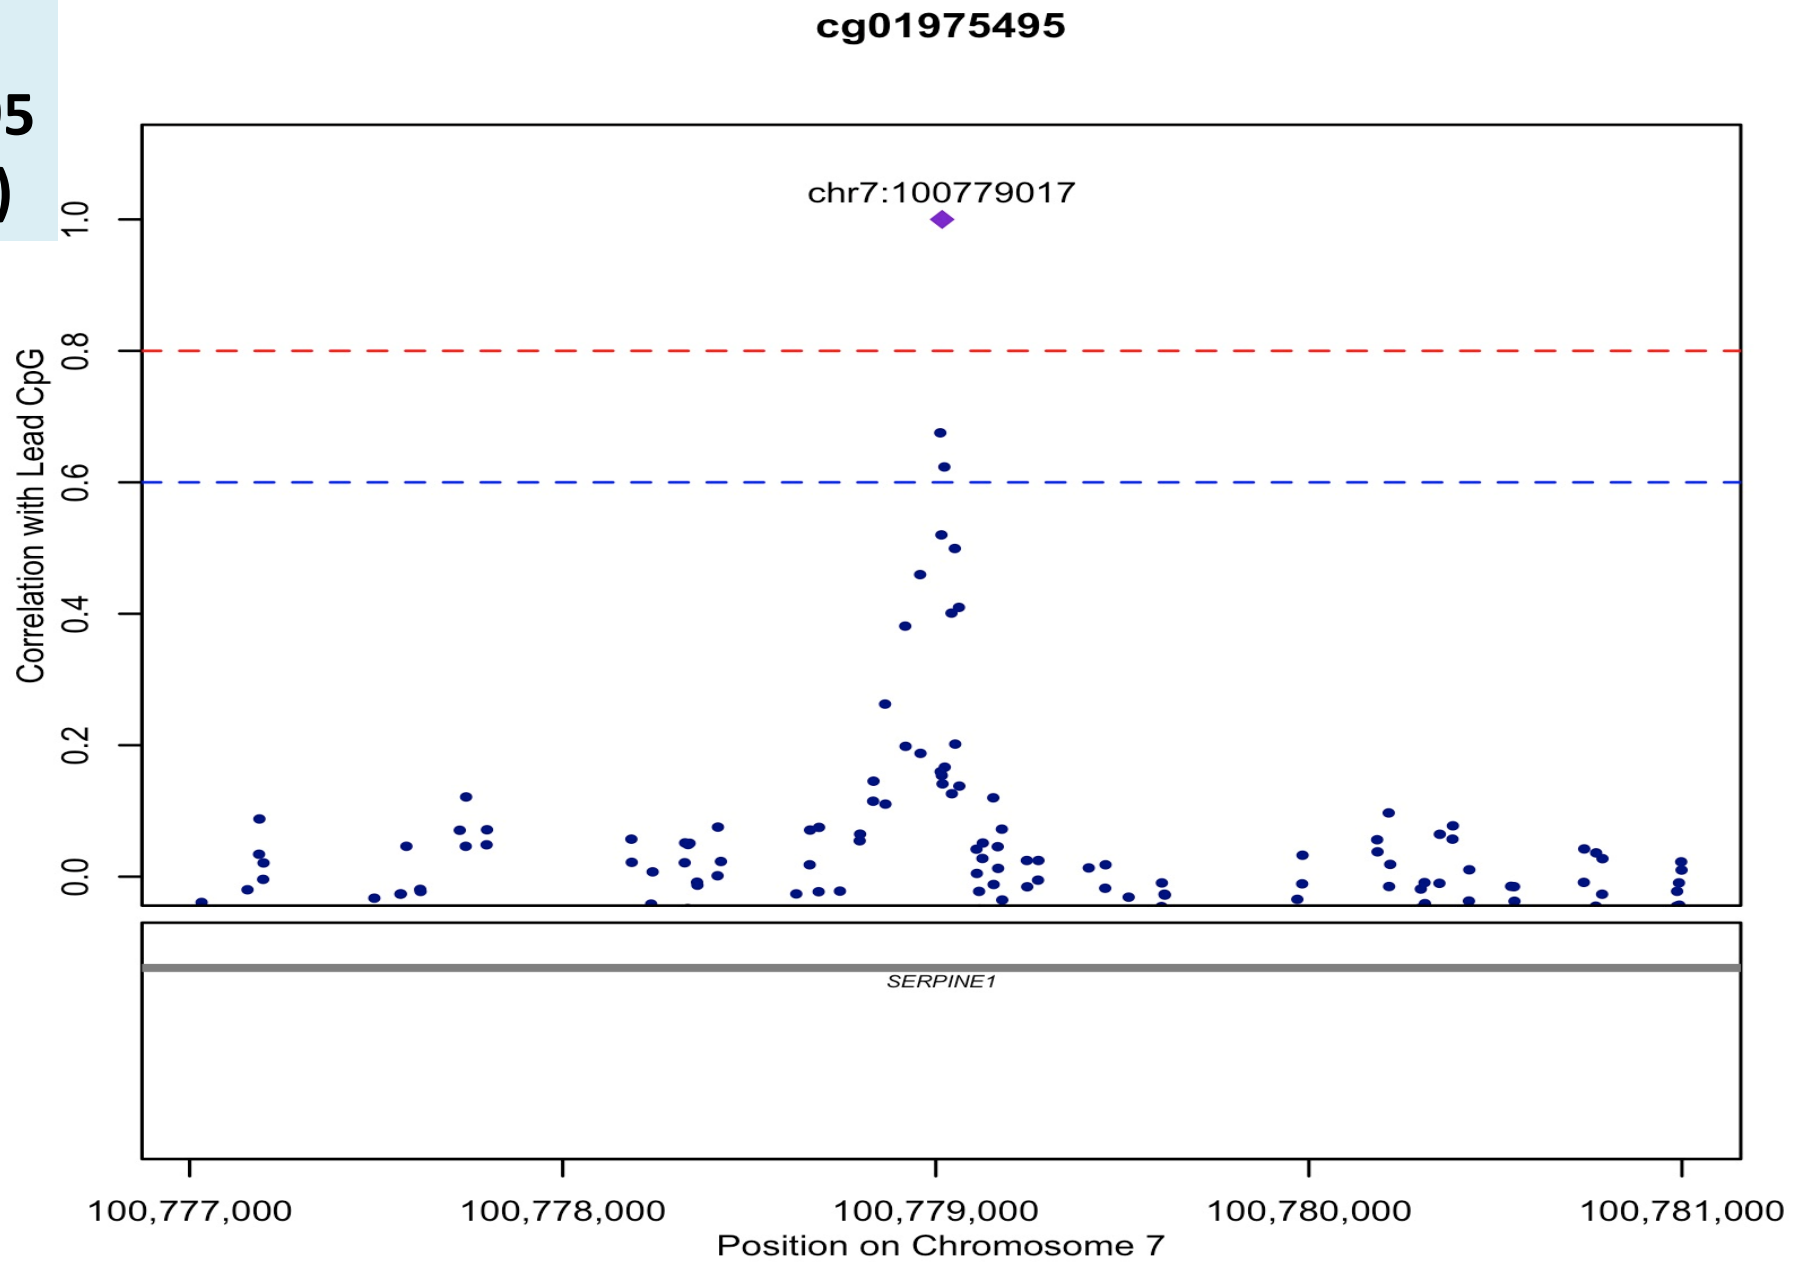

- Array: 1.4%
- 30x WGBS: 7.5%

$$S^2_{\text{total}} = S^2_{\text{biological}} + S^2_{\text{technical}}$$

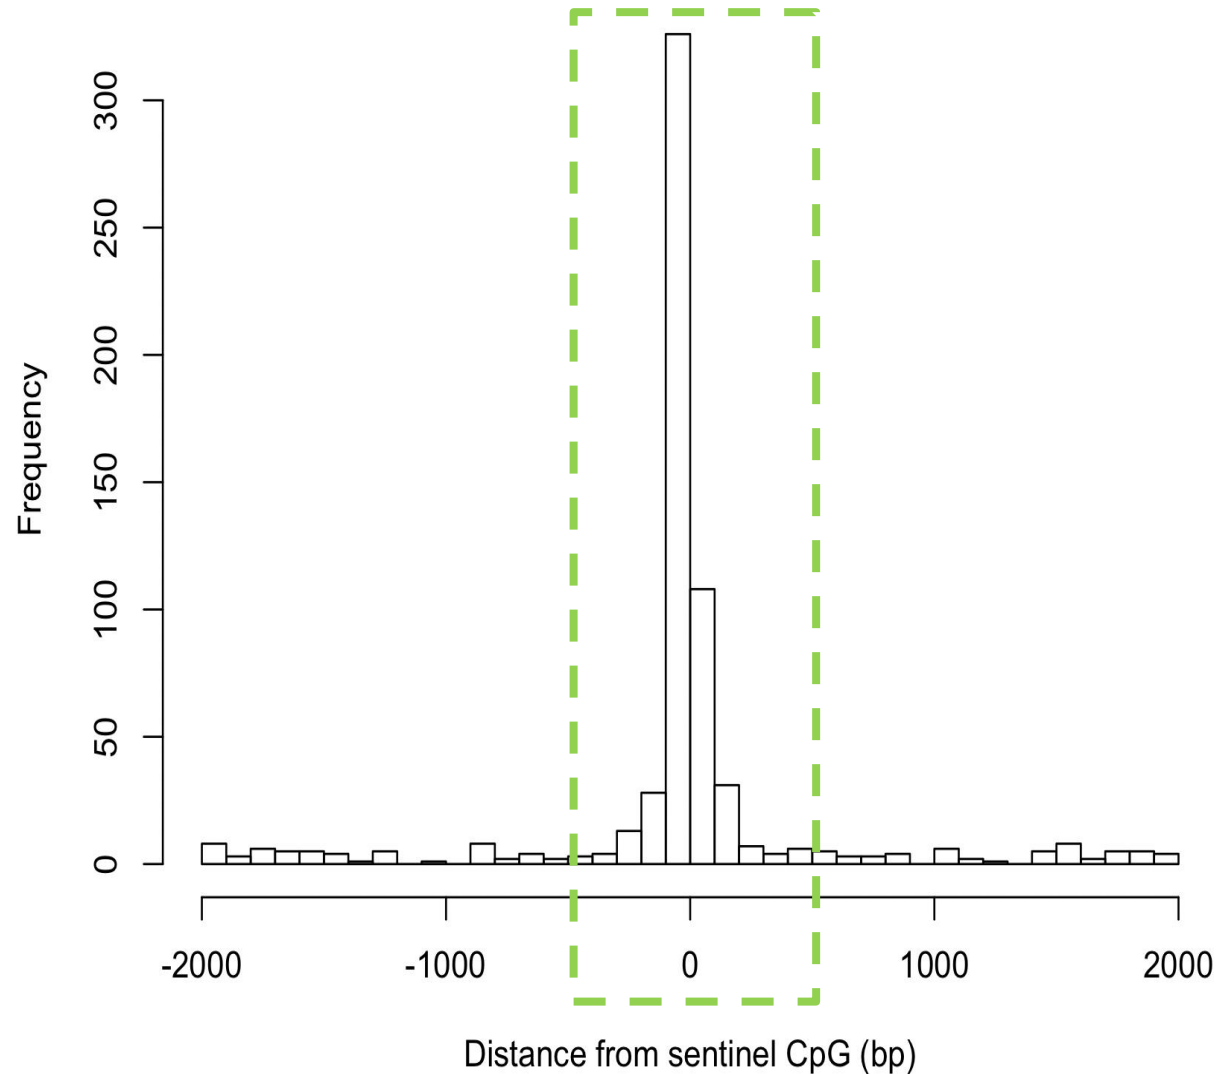

30x WGBS:

$$S^2_{\text{technical}} \gg S^2_{\text{biological}}$$

Example:
cg01975495
(*SERPINE1*)

Distribution of distance of most outlying CpG with $|r| > 0.2$ from sentinel CpG

- Inspected correlation based on WGBS (within +/- 2kb)
- Most of the correlation appears to be within +/-500bp from sentinel CpG

Twist Methylation Sequencing

New Solutions for Methylation Sequencing:

Exceptional Performance

Unparalleled Uniformity

Sensitivity

Rapid Panel Iteration

Design Flexibility

Stringency

Quantitatively Tune On-target Performance:

Stringency Control for High Quality Pre-optimized Designs

Pilot Study

- TWIST Methylome Panel (~5M markers)
- 16 samples (500ng DNA in total)
- Samples split equally
- Library prep / sequencing in duplicate (SG and US)
- Aimed to achieve ~500x raw sequencing

Concordance between duplicates

>100x coverage
at 77% of sites

	rho	MAE	#Common	#Unique
Mean	0.9986	1.29	6,367,108	157,562
S.D.	0.0007	0.28	95,816	84,273

Max	0.9992	2.12	6,601,365	457,757

Strategy for TWIST targeted methylation sequencing

- 2,000 samples, 500x sequencing
- 500MB sequence target selected as:
 - Minimum +/-500bp from sentinel CpG for all loci
 - Inspected +/-2kb for correlated markers (2kb prior literature), and extend interval up/downstream to include CpGs with $|r| > 0.2$
 - Where the outermost CpG is close to (within 100bp) 2kb boundary of initial evaluation of correlation, further extend the region of evaluation to +/-5kb.
- Results Watch this space

Translation to clinic

Wrap-up

- Diabetes is a critical public health problem, with a need for new predictive biomarkers and preventative treatments.
- Methylation array studies identify >400 methylation markers for future diabetes
 - Biologically compelling
 - Independent predictive value >> genetic risk
- Fine mapping studies designed based on methylome sequencing and underway using targeted methylation panels
